Errata

On Graham and Coppock (2021), *Public Opinion Quarterly* 85(1)

This note lists fifteen corrections to "Asking About Attitude Change," published in *Public Opinion Quarterly* 85(1), doi 10.1093/poq/nfab009: one appendix table whose column headings are in the wrong order, two corrections to a single sentence that describes the estimates incorrectly, two misstated numbers, and nine errors in the reference list. **None of them changes a conclusion of the paper.** The evidence behind the paper's argument, that the change format gets the sign of an effect wrong far more often than the counterfactual format does, is unaffected.

Every number in a corrected sentence below, outside the reference list, is computed from the deposited replication archive (10.7910/DVN/GFF78K) at the time this document is rendered, including the numbers that were not wrong. The code and output supporting each correction are at github.com/active-maintenance-aec/graham_coppock_2021.

Every quantity on the percentage scale is stated to one decimal place, and bold marks the corrections. A corrected sentence therefore differs from the published one in more places than it is wrong: the article states these quantities in whole points, and setting a whole number to one decimal is not a correction. Only what is bold has changed.

1. Table D.3's second and third value columns are headed in the wrong order

Table D.3 is headed `More | No change | Less | Difference`. Its body is in the order `More | Less | No change | Difference`, so every reader of the published table who takes the second column for the share reporting no change is reading the share reporting less, and the reverse.

The table's own Difference column is what settles which side is wrong. In 84 of its 84 rows the printed Difference equals More minus the column headed "No change", to within the one unit in the last printed digit that rounding each cell separately allows. It equals More minus the column headed "Less" in 2 of them. Since the difference the article defines is the share reporting more minus the share reporting less, the column headed "No change" holds the share reporting less. The main text reads the body the same way: of the Study 1 disputed accusation row for Democrats it says that "a huge majority of Democratic respondents (87 percent) report that the accusation made them less likely to vote for Cornish," and 86.8 is

the entry under "No change"; of the Republican row it says "most Republicans (57 percent) reported that the information had no effect," and 56.8 is the entry under "Less".

The table is what is corrected, not any sentence. Every cell in the published body is right and sits in the right place; the two headings over the second and third value columns are transposed. Table D.3 is reprinted below with the headings in the order the body uses. The numbers are unchanged: they are recomputed from the deposited data and reproduce the published table cell for cell.

Table 1: Table D.3 corrected: Distribution of Change Format by Study and Treatment. Standard errors in parentheses. Only the headings over the third and fourth value columns differ from the published table.

Treatment	Party	Level Q?	N	More	Less	No change	Difference
Blocked whistleblower (Study 1)	Democrat	No	53	22.6 (5.8)	45.3 (6.9)	32.1 (6.5)	-22.6 (11.0)
Blocked whistleblower (Study 1)	Democrat	Yes	46	13.0 (5.0)	50.0 (7.5)	37.0 (7.2)	-37.0 (10.5)

Table 1: Table D.3 corrected: Distribution of Change Format by Study and Treatment. Standard errors in parentheses. Only the headings over the third and fourth value columns differ from the published table. *(continued)*

Treatment	Party	Level Q?	N	More	Less	No change	Difference
Mueller comments (Study 3)	Independent	No	131	33.6 (4.3)	16.8 (3.5)	49.6 (4.6)	16.8 (6.4)
Mueller comments (Study 3)	Independent	Yes	114	23.7 (4.0)	14.0 (3.3)	62.3 (4.6)	9.6 (5.7)
Mueller comments (Study 3)	Republican	No	168	12.5 (2.9)	33.3 (4.0)	54.2 (4.2)	-20.8 (5.5)
Mueller comments (Study 3)	Republican	Yes	165	13.3 (3.0)	27.9 (3.7)	58.8 (4.1)	-14.5 (5.3)

2. The counterfactual format's sign errors are not all cases in which nothing can be distinguished from zero

> The more-minus-less estimates derived from the change format have the opposite sign as the experimental difference-in-means estimates in 12 out of 20 opportunities, compared with 3 of 20 for the counterfactual format. **In all three of those cases**, neither the counterfactual estimate nor the difference in means estimate can be distinguished from zero.

Corrected:

> The more-minus-less estimates derived from the change format have the opposite sign as the experimental difference-in-means estimates in 12 out of 20 opportunities, compared with 2 of 20 for the counterfactual format. **In one of those two cases**, neither the counterfactual estimate nor the difference in means estimate can be distinguished from zero.

The exception is the disputed accusation among Democrats, where the counterfactual estimate is –0.49 scale points with a 95 per cent interval of (–0.71, –0.27), which excludes zero. The article's own Table D.5 prints –0.49 with an interval of (–0.71, –0.28) for the same cell, so the sentence disagrees with the appendix as well as with the data. The other half of the sentence holds there: the difference in means for that cell is 0.02 with an interval of (–0.61, 0.65). Figure 4 and Table D.5 both carry the correct estimates and are not reprinted. How many cells the sentence should count is a separate correction, entry 5 below, which removes a different cell from the three and leaves this one standing.

What the sentence was there to establish still holds in a narrower form. The counterfactual estimate excludes zero in this cell, but the experiment is imprecise (standard error 0.31), and the difference between the two estimates, 0.51, has a bootstrap interval of (–0.07, 1.09). The cell is not among the six differences the article reports as statistically significant, and the other sign error, supports charters among Democrats, is –0.06 against 0.01 with an interval of (–0.63, 0.78) for their difference. Neither of the counterfactual format's sign errors is a statistically distinguishable disagreement with the experiment.

3. The effect of asking the level question first among Democrats

> The effect is larger among Democrats (**−14** points, SE: 3 points) and Republicans (−8 points, SE: 4 points) than among pure independents (−2 points, SE: 6 points).

Corrected:

> The effect is larger among Democrats (**−13** points, SE: 3 points) and Republicans (−8 points, SE: 4 points) than among pure independents (−2 points, SE: 6 points).

The Democratic estimate is −13.4588 points, which rounds to −13 rather than −14 at the whole-point precision the article uses. The comparison the sentence makes, that the effect is larger among Democrats and Republicans than among pure independents, holds.

4. The correlation between the two impeachment questions

> Panel (a) offers prima facie evidence that subjects are not bewildered by the nonstandard question format: the strong correlation (**0.82**) of the two responses indicates that most subjects believe their counterfactual attitudes would have been very close to their actual attitudes (72 percent report exactly zero change).

Corrected:

> Panel (a) offers prima facie evidence that subjects are not bewildered by the nonstandard question format: the strong correlation (**0.83**) of the two responses indicates that most subjects believe their counterfactual attitudes would have been very close to their actual attitudes (72 percent report exactly zero change).

The correlation is 0.8285, which rounds up rather than down at two decimals. The share reporting exactly zero change is 72.0873 per cent and is correct as published at whole-percent precision.

5. The counterfactual format has two sign errors, not three

> The more-minus-less estimates derived from the change format have the opposite sign as the experimental difference-in-means estimates in 12 out of 20 opportunities, compared with **3 of 20** for the counterfactual format. In all three of those cases, neither the counterfactual estimate nor the difference in means estimate can be distinguished from zero.

Corrected:

> The more-minus-less estimates derived from the change format have the opposite sign as the experimental difference-in-means estimates in 12 out of 20 opportunities, compared with **2 of 20** for the counterfactual format. In one of those two cases, neither the counterfactual estimate nor the difference in means estimate can be distinguished from zero.

One of the three cells the sentence counts, the Trump coal ash executive order among Republicans, has a counterfactual estimate of 0.00 scale points (SE 0.05). An estimate of zero has no sign, so it cannot have the opposite sign of the experiment, and it is not counted here. The Tax Cuts and Jobs Act cell among Republicans is zero in the same way, differing from zero by 1e-17 scale points, and is also not counted.

Comparing the two signs directly, which is what produces the published count, makes the answer turn on the last bits of that second value. The same code over the same data returns 3 under the linear algebra the published archive was run against and 4 under a current one, so the published count is not reproducible in either direction rather than simply being one too high.

The direction of the article's argument is untouched, and the corrected numbers are wider apart than the published ones: the change format gets the sign wrong in 12 of 20 opportunities against the counterfactual format's 2.

6. Page (2009) is printed with a broken URL

> story?id=8316019**&page**=1.

Corrected:

> story?id=8316019**&page**=1.

The URL is printed with a backslash before its ampersand, a LaTeX escape that reached the page. The story (Susan Page, USA Today, August 13, 2009) is at https://abcnews.go.com/amp/Politics/story?id=8316019&page=1.

7. Guess and Coppock (2020) is given the page of its corrigendum

> British Journal of Political Science 50: **1517**.

Corrected:

> British Journal of Political Science 50: **1497–1515**.

Crossref, doi 10.1017/S0007123418000327: the article runs from p. 1497 to p. 1515 of volume 50, issue 4. Page 1517 is its corrigendum (doi 10.1017/S0007123419000024).

8. Jerzy Neyman's given name is misspelled

> Neyman, **Jerzey**. 1923.

Corrected:

> Neyman, **Jerzy**. 1923.

The author is Jerzy Neyman (Jerzy Splawa-Neyman in the 1990 translation, Statistical Science 5(4), doi 10.1214/ss/1177012031).

9. Strack and Martin (1987) prints its editors' names inverted

> Survey Methodology, edited by **J. Hippler Hans, Schwarz Norbert, and Sudman Seymour**, 123–48.

Corrected:

> Survey Methodology, edited by **Hans-J. Hippler, Norbert Schwarz, and Seymour Sudman**, 123–48.

Crossref, doi 10.1007/978-1-4612-4798-2: the volume is edited by Hans-J. Hippler, Norbert Schwarz, and Seymour Sudman. The entry prints each given name after its surname, as if it were one.

10. Strack and Martin (1987) misquotes its own title

> Account of Context Effects in **Attitudes** Surveys.

Corrected:

> Account of Context Effects in **Attitude** Surveys.

Crossref, doi 10.1007/978-1-4612-4798-2_7: the chapter is "Thinking, Judging, and Communicating: A Process Account of Context Effects in Attitude Surveys."

11. Briñol and Petty (2012) prints an editor's name inverted

> Handbook of Self-Knowledge, edited by **Vazire Simine** and Timothy D. Wilson,

Corrected:

> Handbook of Self-Knowledge, edited by **Simine Vazire** and Timothy D. Wilson,

The Handbook of Self-Knowledge (Guilford Press, 2012) is edited by Simine Vazire and Timothy D. Wilson, as the chapter's own header and the publisher's contents page give it.

12. Schryer and Ross (2012) gives its editors in the wrong order

In Social Metacognition, eds. **Kenneth G. DeMarree, Pablo Briñol**, 141–57.

Corrected:

In Social Metacognition, eds. **Pablo Briñol and Kenneth G. DeMarree**, 141–57.

Crossref, doi 10.4324/9780203865989: Social Metacognition (Psychology Press, 2012) is edited by Pablo Briñol and Kenneth G. DeMarree, in that order.

13. Tourangeau, Rips, and Rasinski (2000) gives the first author the wrong given name

Tourangeau, **Robert**, Lance J. Rips,

Corrected:

Tourangeau, **Roger**, Lance J. Rips,

Crossref, doi 10.1017/CBO9780511819322: the first author is Roger Tourangeau.

14. Yair and Huber (2021) misquotes its own title

How Robust Is Evidence of **Perceptual Partisan** Bias in Survey Responses?

Corrected:

How Robust Is Evidence of **Partisan Perceptual** Bias in Survey Responses?

Public Opinion Quarterly 84(2), doi 10.1093/poq/nfaa024: the title is "How Robust Is Evidence of Partisan Perceptual Bias in Survey Responses? A New Approach for Studying Expressive Responding."

15. Yeh et al. (2018) omits its article number

British Medical Journal **363**.

Corrected:

British Medical Journal **363: k5094**.

Crossref, doi 10.1136/bmj.k5094: the article is BMJ 363: k5094. The BMJ paginates by article number, so without it the reference has no locator.
